Transcatheter Mitral Valve Repair
Patient Screening Fact Sheet

Patient eligibility for transcatheter mitral valve repair (TMVR) with MitraClip® therapy is determined by the following criteria:

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Degenerative MR</td>
<td>✓</td>
</tr>
<tr>
<td>Significant mitral regurgitation (MR ≥3+)</td>
<td>✓</td>
</tr>
<tr>
<td>Symptomatic (NYHA functional class III or IV)</td>
<td>✓</td>
</tr>
<tr>
<td>Prohibitive risk criteria, including any of the following:</td>
<td>✓</td>
</tr>
<tr>
<td>• 30-day STS predicted operative mortality risk score of</td>
<td>✓</td>
</tr>
<tr>
<td>• ≥8% (mitral valve replacement)</td>
<td>✓</td>
</tr>
<tr>
<td>• ≥6% (mitral valve repair)</td>
<td>✓</td>
</tr>
<tr>
<td>• Porcelain aorta or extensively calcified ascending aorta</td>
<td>✓</td>
</tr>
<tr>
<td>• Frailty (assessed by in-person cardiac surgeon consultation)</td>
<td>✓</td>
</tr>
<tr>
<td>• Hostile chest</td>
<td>✓</td>
</tr>
<tr>
<td>• Severe liver disease / cirrhosis (MELD Score &gt;12)</td>
<td>✓</td>
</tr>
<tr>
<td>• Severe pulmonary hypertension (systolic pulmonary artery pressure &gt;2/3 systemic pressure)</td>
<td>✓</td>
</tr>
<tr>
<td>• Unusual extenuating circumstance, such as right ventricular dysfunction with severe tricuspid regurgitation, chemotherapy for malignancy, major bleeding diathesis, immobility, AIDS, severe dementia, high risk of aspiration, internal mammary artery at high risk of injury, etc.</td>
<td>✓</td>
</tr>
</tbody>
</table>

Existing comorbidities do not preclude expected benefit of MR reduction

For optimal results, the following anatomic patient characteristics should be considered:

- The primary regurgitant jet is non-commissural. If a secondary jet exists, it must be considered clinically insignificant
- Mitral valve area ≥4.0cm²
- Minimal calcification in the grasping area
- No leaflet cleft in the grasping area
- Flail width <15 mm and flail gap <10 mm
- LVEF >20% or LVESD <60mm

Nearly 1 in 10 people age 75 and older have moderate or severe mitral regurgitation

Do you have significant, symptomatic, degenerative MR patients who are at prohibitive-risk for surgery, and could benefit from this important treatment option?

Connect with a MitraClip therapy center at www.abbottvascular.com/TMVR

For a complete list of patient eligibility criteria, please refer to the MitraClip® Clip Delivery System Instructions for Use.

Source: MitraClip Clip Delivery System Instructions for Use.

MitraClip Clip Delivery System Indication: The MitraClip Clip Delivery System is indicated for the percutaneous reduction of significant symptomatic mitral regurgitation (MR ≥ 3+) due to primary abnormality of the mitral apparatus (degenerative MR) in patients who have been determined to be at prohibitive risk for mitral valve surgery by a heart team, which includes a cardiac surgeon experienced in mitral valve surgery and a cardiologist experienced in mitral valve disease, and in whom existing comorbidities would not preclude the expected benefit from reduction of the mitral regurgitation. See Important Safety Information Referenced Within.
MITRACLIP CLIP DELIVERY SYSTEM

INDICATION FOR USE

The MitraClip Clip Delivery System is indicated for the percutaneous reduction of significant symptomatic mitral regurgitation (MR ≥ 3+) due to primary abnormality of the mitral apparatus (degenerative MR) in patients who have been determined to be at prohibitive risk for mitral valve surgery by a heart team, which includes a cardiac surgeon experienced in mitral valve surgery and a cardiologist experienced in mitral valve disease, and in whom existing comorbidities would not preclude the expected benefit from reduction of the mitral regurgitation.

CONTRAINDICATIONS

The MitraClip Clip Delivery System is contraindicated in DMR patients with the following conditions:

- Patients who cannot tolerate procedural anticoagulation or post procedural anti-platelet regimen
- Active endocarditis of the mitral valve
- Rheumatic mitral valve disease
- Evidence of intracardiac, inferior vena cava (IVC) or femoral venous thrombus

WARNINGS

- Do NOT use MitraClip outside of the labeled indication.
- Treatment of non-prohibitive risk DMR patients should be conducted in accordance with standard hospital practices for surgical repair and replacement.
- MitraClip is contraindicated to reduce mitral regurgitation. The MitraClip procedure is recommended to be performed when an experienced heart team has determined that reduction of MR to ≤2+ is reasonably expected following the MitraClip. If MR reduction to ≤2+ is not achieved, the benefits of reduced symptoms and hospitalizations, improved quality of life, and reverse LV remodeling expected from MitraClip may not occur.
- The MitraClip Device should be implanted with sterile techniques using fluoroscopy and echocardiography (e.g., transesophageal [TEE] and transesophageal TEE) in a facility with on-site cardiac surgery and immediate access to a cardiac operating room.
- Read all instructions carefully. Failure to follow these instructions, warnings and precautions may lead to device damage, user injury or patient injury. Use universal precautions for biohazards and sharps while handling the MitraClip System to avoid user injury.
- Use of the MitraClip should be restricted to those physicians trained to perform invasive endovascular and transseptal procedures and those trained in the proper use of the system.
- The Clip Delivery System is provided sterile and designed for single use only. Cleaning, re-sterilization and/or reuse may result in infection or malfunction of the device or other serious injury or death.
- Inspect all product prior to use. DO NOT use if the package is opened or damaged.

PRECAUTIONS

- Patient Selection:
  - Prohibitive risk is determined by the clinical judgment of a heart team, including a cardiac surgeon experienced in mitral valve surgery and a cardiologist experienced in mitral valve disease, due to the presence of one or more of the following documented surgical risk factors:
    - 30-day STS predicted operative mortality risk score of ≥8% for patients deemed likely to undergo mitral valve replacement or ≥6% for patients deemed likely to undergo mitral valve repair
    - Porcelain aorta or extensively calcified ascending aorta.
    - Frazil (assessed by in-person cardiac surgeon consultation)
    - Hostile chest
    - Severe liver disease / cirrhosis (MELD Score >12)
    - Severe pulmonary hypertension (systolic pulmonary artery pressure >2/3 systemic pressure)
    - Severe extenuating circumstances, such as right ventricular dysfunction with severe tricuspid regurgitation, chemotherapy for malignancy, major bleeding diathesis, immobility, AIDS, severe dementia, high risk of aspiration, internal mammary artery (IMA) at high risk of injury, etc.
    - Evaluable data regarding safety or effectiveness is not available for prohibitive risk DMR patients with an LVEF < 20% or on LVESD > 60mm MitraClip should be used only when criteria for clip suitability for DMR have been met. The major clinical benefits of MitraClip are reduction of MR to ≤2+ resulting in reduced hospitalizations, improved quality of life, reverse LV remodeling and symptomatic relief in patients who have no other therapeutic option. No mortality benefit following MitraClip therapy has been demonstrated.
    - The heart team should include a cardiac surgeon experienced in mitral valve surgery and a cardiologist experienced in mitral valve disease and may also include appropriate physicians to assess the adequacy of heart failure treatment and valvular anatomy.
    - The heart team may determine an in-person surgical consult is needed to complete the assessment of prohibitive risk. The experienced mitral valve surgeon and heart team should take into account the outcome of this surgical consult when making the final determination of patient risk status.
    - For reasonable assurance of device effectiveness, pre-procedural evaluation of the mitral valve and underlying pathologic anatomy and procedural echocardiographic assessment are essential.
    - Any device retrievals to the right atrium or left atrium as a result of device failure or patient bleeding or thrombus.
    - Do not use MitraClip to the intended site; Failure to retrieve MitraClip to the intended site; Failure to retrieve MitraClip System components; Fever or hyperthermia; Gastrointestinal bleeding or infarct; Hematoma; Hemolysis; Hemorrhage requiring transfusion; Hypotension/hypertension; Infection; Injury to mitral valve complicating or preventing later surgical repair; Lymphatic complications; Mesenteric ischemia; MitraClip erosion, migration or malposition; MitraClip Device thrombosis; MitraClip System component(s) embolization; Mitral stenosis; Mitral valve injury; Multi-system organ failure; Myocardial infarction; Nausea/vomiting; Pain; Peripheral ischemia; Prolonged angina; Prolonged ventilation; Pulmonary congestion; Pulmonary thrombo-embolism; Renal insufficiency or failure; Respiratory failure/atelectasis/pneumonia; Septicemia; Shock, Anaphylactic or Cardiogenic; Single leaflet device attachment (SLDA); Skin injury or tissue changes due to exposure to ionizing radiation; Stroke or transient ischemic attack (TIA); Urinary tract infection; Vascular trauma, dissection or occlusion; Vessel spasm; Vessel perforation or laceration; Worsening heart failure; Worsening mitral regurgitation; Wound dehiscence.

techniques using fluoroscopy and echocardiography (e.g., transesophageal [TEE] and transesophageal TEE) in a facility with on-site cardiac surgery and immediate access to a cardiac operating room.

• The Steerable Guide Catheter is designed for single use only.
• Cleaning, re-sterilization and/or reuse may result in infections, malfunction of the device or other serious injury or death.
• Patients with the following considerations in whom the Steerable Guide Catheter is used may have an increased risk of having a serious adverse event which may be avoided with preoperative evaluation and proper device usage.
• Previous interstitial septal patch or prosthetic aortic valve defect (ASD) closure device which could result in significant difficulty in visualization or technical challenges during transseptal puncture and/or introducing the SGC into the left atrium.
• Known or suspected unstable angina or myocardial infarction within the last 12 weeks could increase the procedural morbidity and mortality, due to increased hemodynamic stress secondary to general anesthesia.
• Patients with active infection have an increased risk of developing an intraoperative and/or postoperative infection, such as sepsis or soft tissue abscess.
• Known or suspected left atrial myxoma could result in thromboembolism and tissue injury due to difficulty with device positioning.
• Recent cerebrovascular event (CVA) may increase the procedural morbidity associated with a transcatheter intervention, such as recurrent stroke.

PRECAUTIONS

NOTE: The “Use by” date specified on the package. Inspect all product prior to use. Do not use if package is opened or damaged.

The inside of the outer pouch is not a sterile barrier. The

MitraClip System component(s) Embolization; Mitral stenosis; Mitral valve injury; Multi-system organ failure; Myocardial infarction; Nausea/vomiting; Pain; Peripheral ischemia; Prolonged angina; Prolonged ventilation; Pulmonary congestion; Pulmonary thrombo-embolism; Renal insufficiency or failure; Respiratory failure/atelectasis/pneumonia; Septicemia; Shock, Anaphylactic or Cardiogenic; Single leaflet device attachment (SLDA); Skin injury or tissue changes due to exposure to ionizing radiation; Stroke or transient ischemic attack (TIA); Urinary tract infection; Vascular trauma, dissection or occlusion; Vessel spasm; Vessel perforation or laceration; Worsening heart failure; Worsening mitral regurgitation; Wound dehiscence.

POTENTIAL Complications and Adverse Events

The following are complications and adverse events that have been reported:

- Allergic reaction (anesthetic, contrast, Heparin, nickel alloy, latex); Anemia or pseudo-anemia; Arrhythmias; Atrial fibrillation; Atrial septal defect requiring intervention; Arterio-venous fistula; Bleeding; Cardiac arrest; Cardiac perforation; Cardiac tamponade; Pericardial Effusion; Chordal transection/rupture; Coagulation; Conversion to standard valve surgery; Death; Deep venous thrombosis (DVT); Dislodgement of previously implanted devices; Dizziness; Drug reaction to anti-platelet/anticoagulation agents;contrast media; Dyskinesis; Diypnea; Edema; Emboli (air, thrombus, MitraClip Device); Emergency cardiac surgery; Endocarditis; Esophageal irritation; Esophageal perforation or stricture; Failure to deliver MitraClip to the intended site; Failure to retrieve MitraClip System components; Fever or hyperthermia; Gastrointestinal bleeding or infarct; Hematoma; Hemolysis; Hemorrhage requiring transfusion; Hypotension/hypertension; Infection; Injury to mitral valve complicating or preventing later surgical repair; Lymphatic complications; Mesenteric ischemia; MitraClip erosion, migration or malposition; MitraClip Device thrombosis; MitraClip System component(s) embolization; Mitral stenosis; Mitral valve injury; Multi-system organ failure; Myocardial infarction; Nausea/vomiting; Pain; Peripheral ischemia; Prolonged angina; Prolonged ventilation; Pulmonary congestion; Pulmonary thrombo-embolism; Renal insufficiency or failure; Respiratory failure/atelectasis/pneumonia;
